After Complaints, YouTube Kids App Will Finally Let Parents Fully Lock Down What Their Children Can Watch

By TODD SPANGLER

Not JUST privacy, security, & manipulation!

We are also concerned about basic features and functionality.

CREDIT: YOUTUBE

More than three years after launching the tyke-targeted YouTube Kids app — which has turned out to not as clean and well-lit as YouTube had initially touted — the video giant is going to introduce features to help parents handpick exactly what content their children are allowed t Privacy settings

Can we build Responsible Autonomous Systems? Can we put humans in control? Can we build Responsible Autonomous Systems? Can we put humans in control?

AGENDA:

Multiagent Responsible technologies Ethical code and self-regulated communities. A Roadmap to Responsible Autonomy. Value-Alignment Wrap-up

Multiagent Responsible Technologies

Responsible Research

research and innovation must respond to the needs and ambitions of society, reflect its values, and be responsible

European Commission on Responsible Research & Innovation

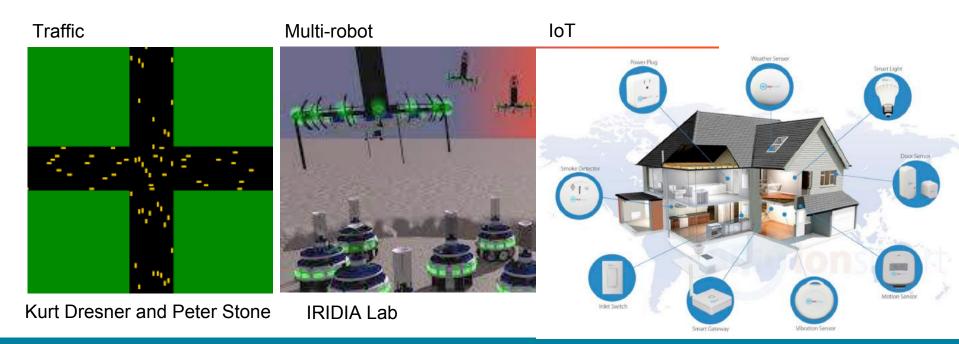

Responsible Technologies

technologies that respond to the needs and ambitions of society, reflect its values, and put people in control.

proposed definition for Responsible Technologies

To put people in control, because AI must be social

Billions of AI systems will interact among themselves and with humans. Our future society will be a colossal Multiagent System, a huge **sociotechnical community**.

MAS: meeting point for AI (technology) and Humanities (people).

From individual rationality to social intelligence we need:

- Communicative interaction
- Social Co-ordination
- Agreement technologies
- Social networks
- Social choice
- Agent-based modelling
- Social simulation

Matthew Yee-King, Roberto Confalonieri, Dave de Jonge, Katina Hazelden, Carles Sierra, Mark d'Inverno, Leila Amgoud, Nardine Osman:

Multiuser museum interactives for shared cultural experiences: an agent-based approach. AAMAS 2013: 917-924

But how to guarantee responsible behaviour when entities are autonomous?

- Responsible behaviour is a social convention. No universals; it is context dependent. It relates to the particular shared values of the community members.
- No individual behaviour guarantee can be obtained when systems are fully autonomous, but we can design sociotechnical communities so that unacceptable behaviour generates repair actions and punishements. (This is the legal approach.) And, desirable behaviour is geared via incentives. (This is the economic approach.)

But how to guarantee responsible behaviour when entities are autonomous?

- Responsible behaviour is a social convention. No universals; it is context dependent. It relates to the particular shared values of the community members.
- No individual behaviour guarantee can be obtained when systems are fully autonomous, but we can design sociotechnical communities so that unacceptable behaviour generates repair actions and punishements. (This is the legal approach.) And, desirable behaviour is geared via incentives. (This is the economic approach.)

Let's get inspiration from how we humans model responsible behaviour.

Legal Relations

(1)(2) (3) (4) Right No-right Privilege Power Immunity JURAL OPPOSITES Duty Disability Liability (1) (2) (3) (4) Right Duty Privilege Power Immunity JURAL CORRELATIVES No-right Liability Disability

Wesley Newcomb Hohfeld. Fundamental Legal Conceptions as Applied in Judicial Reasoning, 23 YALE L.J. 16 (1913).

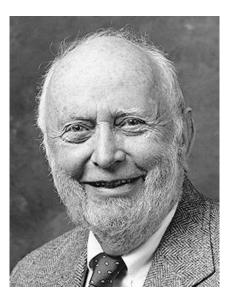

Legal Knowledge Representation in Hohfeld

- Basic deontic operators
- Power
- Multi agency
- Time

Hohfeld's Fundamental Legal Conceptions	LEGAL RELATIONS (LR)* Defined terms in the LEGAL RELATIONS Language (LRL) are in upper case.		
	Unconditional (Deontic)	CONDITIONAL	
		Capacitive	Other CONDITIONAL
duty	DUTY(s,a,b)		CONDITIONAL(c,DUTY(s,a,b))
right	RIGHT(s,b,s)		CONDITIONAL(c,RIGHT(s,b,a))
privilege	PRIVILEGE(s,a,b)		CONDITIONAL(c,PRIVILEGE(s,a,b))
no-right	NO_RIGHT(s,b,a)		CONDITIONAL(c,NO_RIGHT(s,b,a))
	There are 1588 other different deontic LRs.	There are an infinite number of other capacitive LRs.	There are an infinite number of other noncapacitive CONDITIONAL LR, i.e., CONDITIONAL(c,LR).
power		POWER(D2(x,b),LR)	CONDITIONAL(c,POWER(D2(x,b),LR))
liability		LIABILITY(LR,D2(x,b))	CONDITIONAL(c,LIABILITY(LR,D2(x,b)))
disability		DISABILITY(D2(x,b),LR)	CONDITIONAL(c,DISABILITY(D2(x,b),LR))
immunity		IMMUNITY(LR,D2(x,b))	CONDITIONAL(c,IMMUNITY(LR,D2(x,b)))

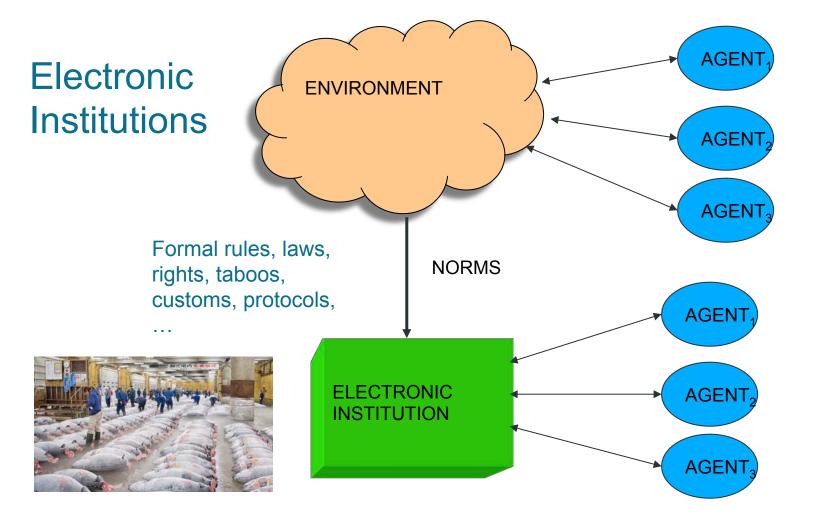

Legal Relation Language by Layman E. Allen. Applied Deontic Logic.

Mark d'Inverno, Michael Luck, Pablo Noriega, Juan A. Rodríguez-Aguilar, Carles Sierra: Communicating open systems. <u>Artif. Intell. 186</u>: 38-94 (2012) Sustainable Collective Action. Self-Governing Institutions.

the COMMONS

ELINOR OSTROM

The Evolution of Institutions for Collective Action

> Political Economy of Institutions and Decisions

L'Horta watering communities

- May 29, 1435, 84 irrigators approved formal regulations on how to share water.
- Some rules had been in use from much earlier.
- Rules talk about maintenance, fines, officials, and use of water depending on the environment.
- They are an example of situatedness.

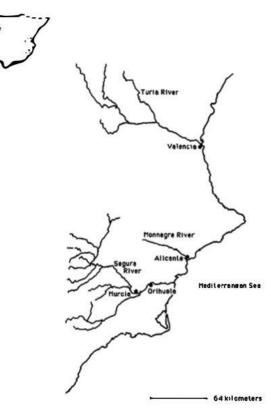

Figure 3.1. Location of Spanish Intertas.

Human communities are often successful

Ostrom's principles and the *Horta*

Boundaries: irrigation rights come with the land. **Appropiation and provision**: proportional to size of land.

Collective choice: election of officials in the court.

Monitoring: 'turno' system makes monitoring high and easy.

Sanctions: surprisingly low frequency. 0,8%. **Conflict**: weekly meetings.

Rights to organise: no external interference

- Clearly defined boundaries
 Individuals or households who have rights to withdraw resource units from the CPR must be clearly defined, as must the boundaries of the CPR itself.
- Congruence between appropriation and provision rules and local conditions Appropriation rules restricting time, place, technology, and/or quantity of resource units are related to local conditions and to provision rules requiring labor, material, and/or money.
- 3. Collective-choice arrangements

Most individuals affected by the operational rules can participate in modifying the operational rules.

4. Monitoring

Monitors, who actively audit CPR conditions and appropriator behavior, are accountable to the appropriators or are the appropriators.

5. Graduated sanctions

Appropriators who violate operational rules are likely to be assessed graduated sanctions (depending on the seriousness and context of the offense) by other appropriators, by officials accountable to these appropriators, or by both.

6. Conflict-resolution mechanisms

Appropriators and their officials have rapid access to low-cost local arenas to resolve conflicts among appropriators or between appropriators and officials.

7. Minimal recognition of rights to organize

The rights of appropriators to devise their own institutions are not challenged by external governmental authorities.

For CPRs that are parts of larger systems:

8. Nested enterprises

Appropriation, provision, monitoring, enforcement, conflict resolution, and governance activities are organized in multiple layers of nested enterprises.

Ethical code and self-regulated communities.

What is an ethical code

- The norms that regulate the behaviour of communities. They are of different sorts
 - Legal (institutional) norms. Imposed.
 - Community norms. Based on shared values, collective behaviour.
 - Individual norms. Based on individual preferences and values.
- Behaviour and the environment impact the fulfilment of needs and the adherence to values. The ethical code must be dynamic. Change is triggered by unsatisfied needs and evolving values.

Legal Norms. Hammurabi code. 1754 BCE.

Retributive justice. TFT.

Law 196: If a man destroy the eye of another man, they shall destroy his eye. If one break a man's bone, they shall break his bone. If one destroy the eye of a freeman or break the bone of a freeman he shall pay one gold mina. If one destroy the eye of a man's slave or break a bone of a man's slave he shall pay one-half his price.

Community norms

- Each farm on a canal receives water in a rotation order.
- If a farmer fails to open his headgate when the water arrives there, he misses his turn and must wait for the next rotation.
- Each farmer decides how much water to take.
- The households to receive timber form teams and equaly divide the work.
- Workers will make equaly sized piles of logs.
- A lottery determines which pile goes to which household.

Individual norms

- Don't show me messages during my afternoon nap
- Don't show me messages from people that are not in my contact list.
- Don't show me requests coming from men.

Formalisms for normative systems.

If-Then rules (e.g. Hammurabbi) Conditional Deontic Logic with Deadlines **Event Calculus** Hybrid Metric Interval Temporal Logic Social Integrity Constraints **Object Constraint Language Constraint rule-based Normative Temporal Logic**

Constraint rule-based

Punishment – We must punish those agents when issuing a winning bid they cannot pay for. More precisely, the rule punishes an agent A1 by decreasing its credit of 10% of the value of the good being auctioned. The oav predicate on the LHS of the rule represents the current credit of the offending agent. The rule also adds an obligation for the auctioneer to restart the bidding round and the constraint that the new offer should be greater than 120% of the old price.

$$\begin{pmatrix} X = \begin{cases} \alpha_0 \middle| \alpha_1 \& (T_0 > T_1) \& \\ \operatorname{not}(\alpha_2 \& (T_2 > T_1)) \\ \operatorname{oav}(A_1, \operatorname{credit}, C) \& \\ (\operatorname{size}(X) = 1) \& (C < P) \& \\ C2 = C - P * 0.1 \end{pmatrix} & \rightsquigarrow \begin{pmatrix} \operatorname{del}(\operatorname{oav}(A_1, \operatorname{credit}, C)), \\ \operatorname{add}(\operatorname{oav}(A_1, \operatorname{credit}, C2)), \\ \operatorname{add}(\alpha_3) \end{pmatrix}$$

where $\begin{cases} \alpha_0 = utt(dutch, w_4, inform(A_1, buyer, Au, auct, bid(It, P), T_0))\\ \alpha_1 = utt(dutch, w_3, inform(Au, auct, all, buyer, offer(It, P), T_1)),\\ \alpha_2 = utt(dutch, w_3, inform(Au, auct, all, buyer, offer(It, P), T_2))\\ \alpha_3 = obl(dutch, w_5, inform(Au, auct, all, buyer, offer(It, P * 1.2), T_3)) \end{cases}$

Andrés García-Camino, Juan A. Rodríguez-Aguilar, Carles Sierra, Wamberto Weber Vasconcelos: Constraint rule-based programming of norms for electronic institutions. Autonomous Agents and Multi-Agent Systems 18(1): 186-217 (2009)

Normative Temporal Logic. SNL.

```
module toggle controls x

init

\ell_1 : \top \rightsquigarrow x' := \top

\ell_2 : \top \rightsquigarrow x' := \bot

update

\ell_3 : x \rightsquigarrow x' := \bot

\ell_4 : (\neg x) \rightsquigarrow x' := \top
```

```
normative-system id
\chi_1 disables \ell_{1_1},\ldots,\ell_{1_k}\ldots\chi_m disables \ell_{m_1},\ldots,\ell_{m_k}
```

<u>Thomas Ågotnes</u>, <u>Wiebe van der Hoek</u>, <u>Juan A. Rodríguez-Aguilar</u>, Carles Sierra, <u>Michael J. Wooldridge</u>: On the Logic of Normative Systems. <u>IJCAI 2007</u>: 1175-1180

Normative Temporal Logic. SNL.

```
module toggle controls x
init
\ell_1 : \top \rightsquigarrow x' := \top
\ell_2 : \top \rightsquigarrow x' := \bot
```

update

 $\ell_3: x \rightsquigarrow x' := \bot$

 $\ell_4: (\neg x) \rightsquigarrow x' := \top$

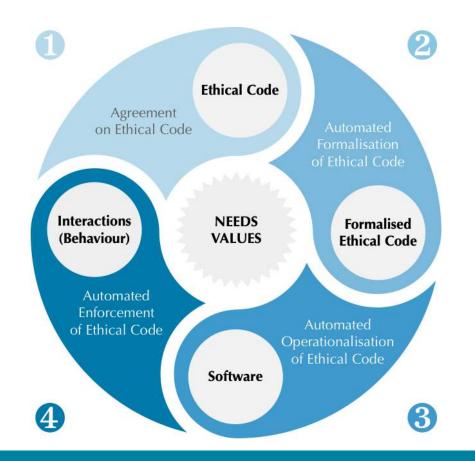

```
normative-system id
\chi_1 disables \ell_{1_1},\ldots,\ell_{1_k}
\ldots
\chi_m disables \ell_{m_1},\ldots,\ell_{m_k}
```

But

Maybe more expressivity is needed, based on Hohfeld, blending *Deontic*, *power*, *multiagent*, and *temporal* concepts.

<u>Thomas Ågotnes</u>, <u>Wiebe van der Hoek</u>, <u>Juan A. Rodríguez-Aguilar</u>, Carles Sierra, <u>Michael J. Wooldridge</u>: On the Logic of Normative Systems. <u>IJCAI 2007</u>: 1175-1180

Responsible autonomy life-cycle

Some illustrative examples

Birth of Norms:

Members of the Anthropology Class of 2019 agree on a new norm:

()

Winning norm:

If someone uploads a photo, then only they can add tags.

Voting Trigger:

It seems each one has presented their view and discussed it. Let us vote.

Norm Suggestion:

What about restricting who can tag. Maybe the owner of the photo?

Anna

Argument: I think disabling tagging is too strict.

Anna

Mark

Dave

Norm Suggestion: I suggest to disable tagging!

Opinion: Me too! My photos page is cluttered!

Evolution Trigger:

I am not happy that anyone can tag anyone else in a photo. I suggest we change this rule.

Norm Formalisation (automated):

The norm in [restricted] natural language is formalised.

upload_photo(Someone, Photo) \Longrightarrow

¬ tag(SomeoneElse, Photo, TaggedPerson)

 \land SomeoneElse \neq Someone

Norm Operationalisation (automated):

The formal norm is operationalised.

alert("You cannot tag this photo. Only the owner can tag this photo.");

Norm Enforcement (automated):

The photo cannot be tagged by anyone other than the owner.

You cannot tag this photo. Only the owner can tag the photo.

Anna

Birth of Norms:

Members of the Anthropology Class of 2019 modify a norm:

Winning norm:

If the tagged person does not accept to be tagged, then the tag is not added.

Voting Trigger: It seems no one objects. Please confirm by voting.

Maya

Argument:

I look horrible in some photos! I should be consulted first.

Argument: This seems reasonable.

Norm Suggestion:

Anna

Dave

Mark

Opinion:

Fully agree!

Evolution Trigger: I am not happy I am being tagged without my consent. I suggest we change this.

I suggest not to tag anyone without their consent!

Norm Formalisation (automated):

The norm in [restricted] natural language is formalised.

¬ accept_tag(TaggedPerson, Photo) ⇒¬ add_tag(Photo, TaggedPerson)

8

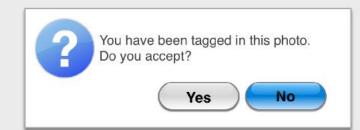

Norm Operationalisation (automated): The formal norm is operationalised.

if (confirm('You have been tagged in this photo. Do you accept?')) { addTag(); } else { deleteTag(); }

4

Norm Enforcement (automated):

The photo is not tagged before the user being tagged accepts.

Single mothers community in uHelp.

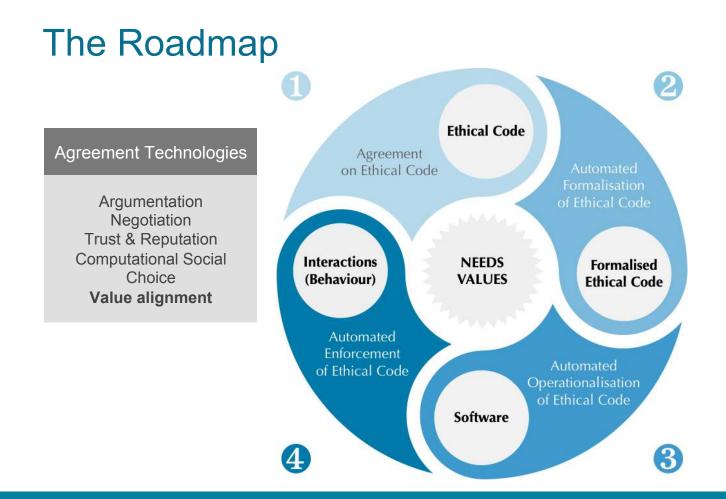

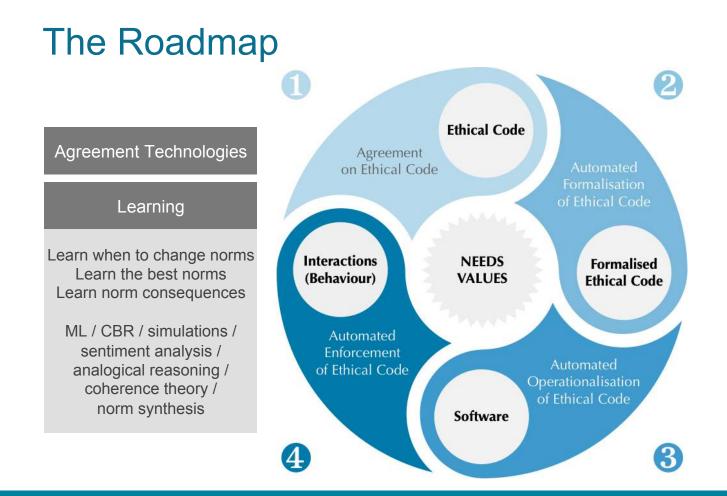

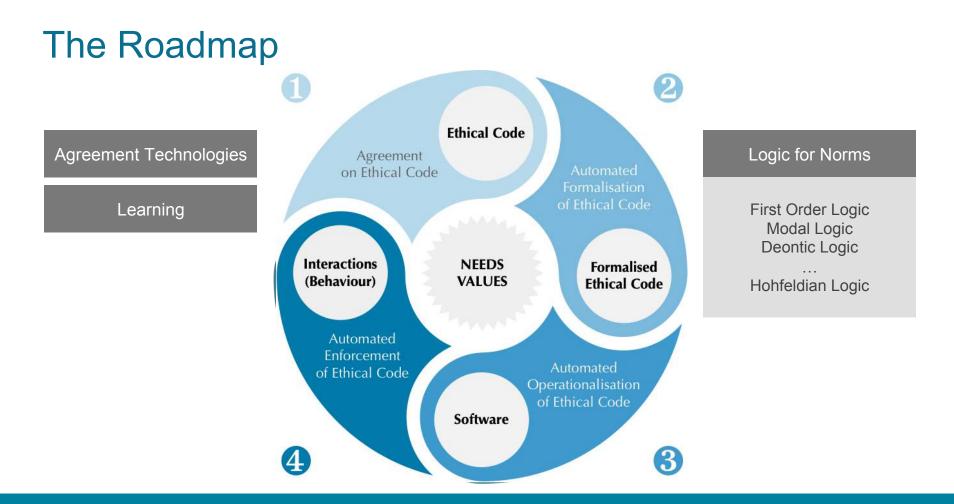

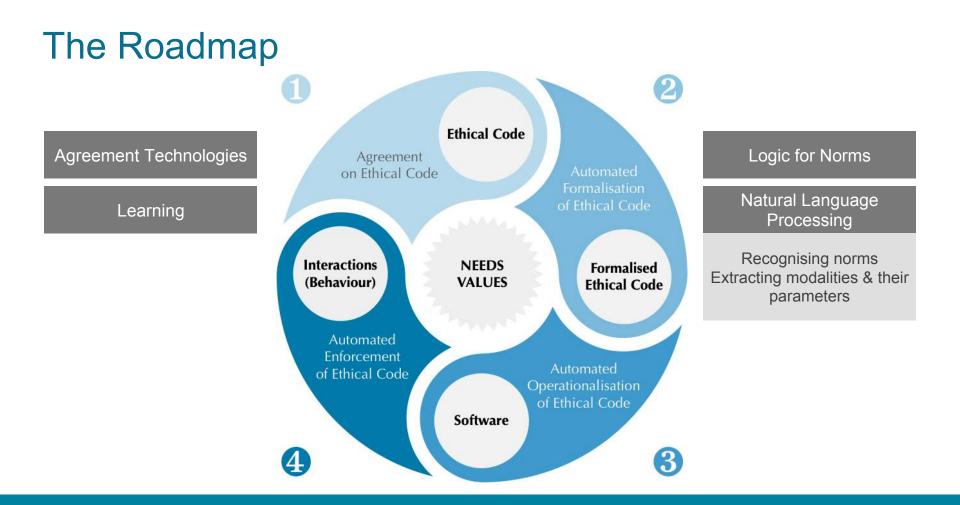

A Roadmap to Responsible Autonomy. Combination of techniques.

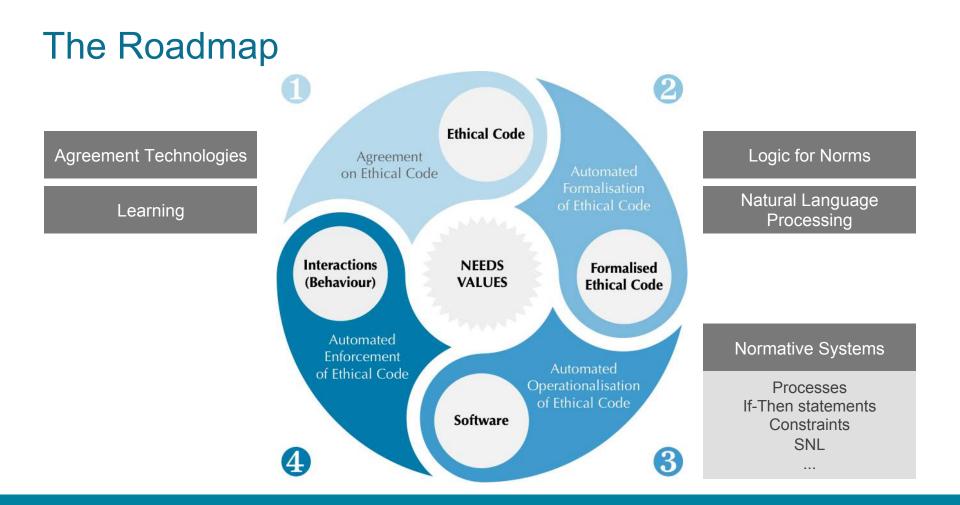

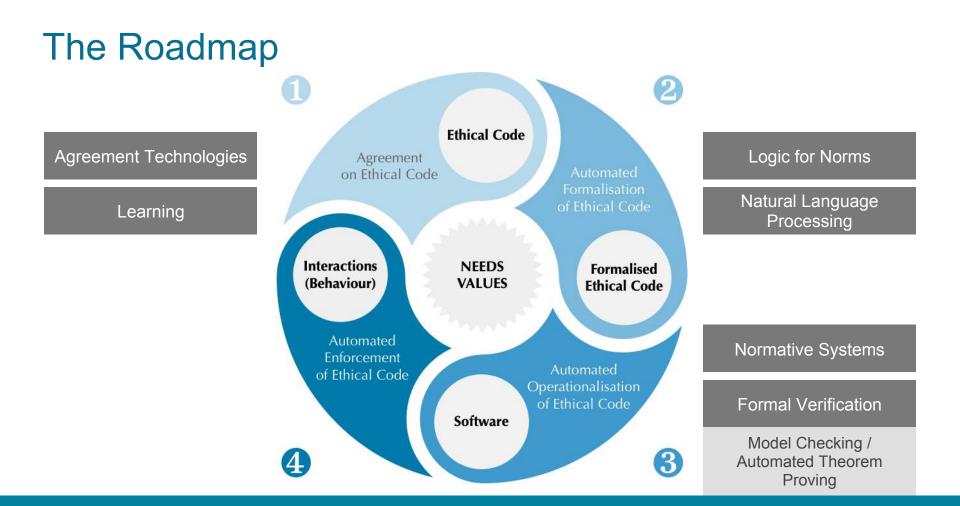

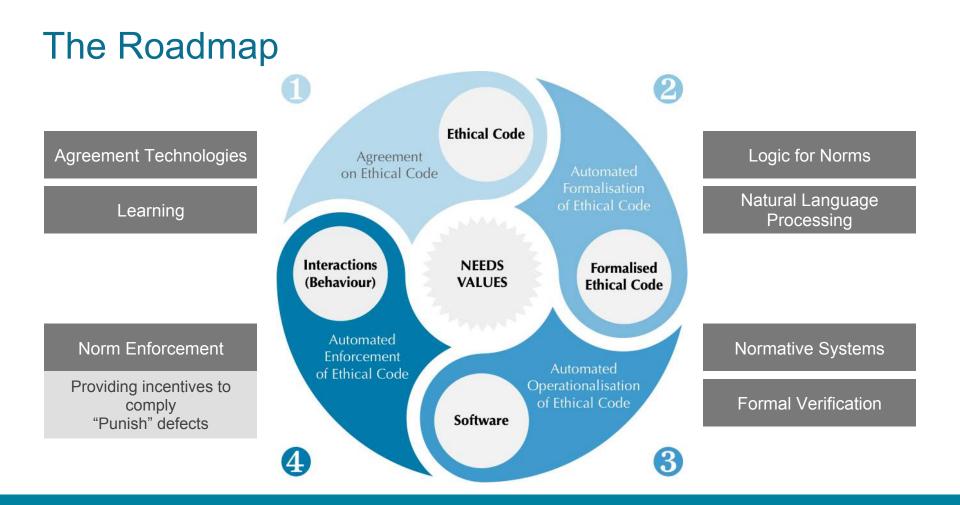

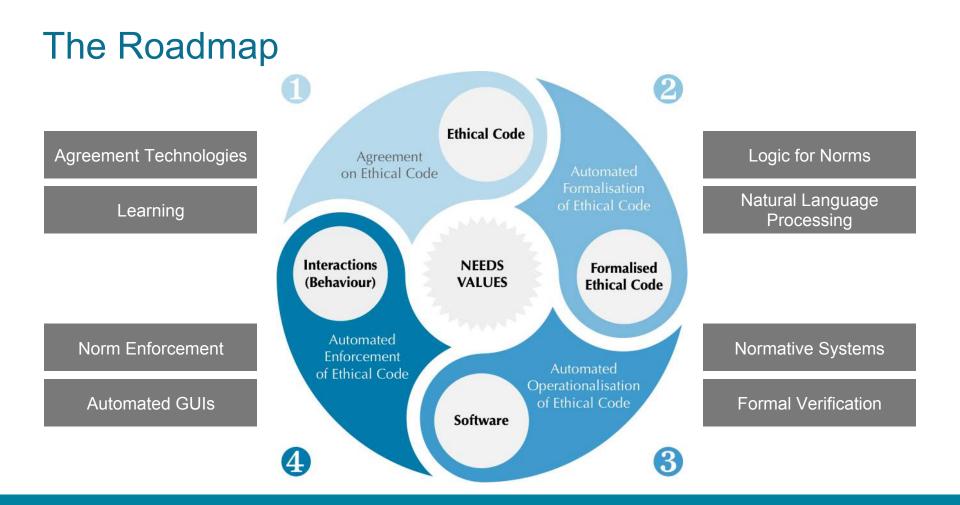

Every component is difficult. One element of the roadmap: Value Alignment - one of the main issues in Responsible AI today

Carles Sierra, Nardine Osman, Pablo Noriega, Jordi Sabater Mir and Antoni Perello-Moragues

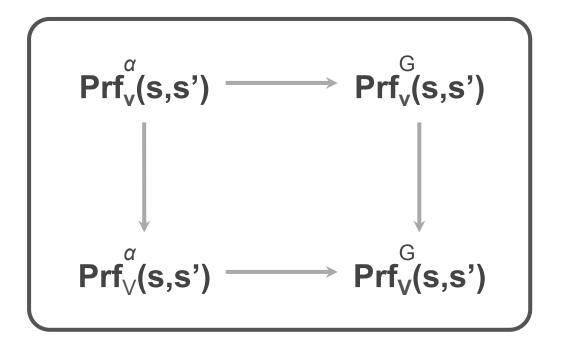

Value alignment: a formal approach RAIA Workshop, AAMAS 2019

Values as preferences

Values are understood as preferences over behaviour, or preferences over the states of the world: $Prf_v^{\alpha}(s,s')$

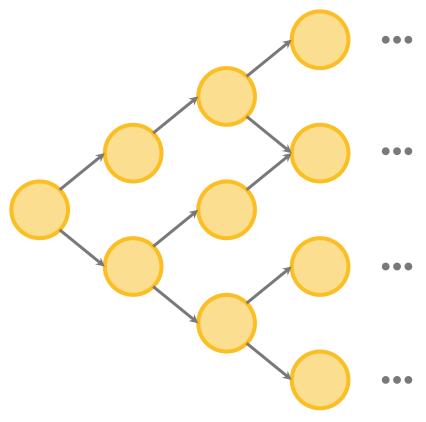

Aggregation of value-based preferences

Value alignment problem: the concept

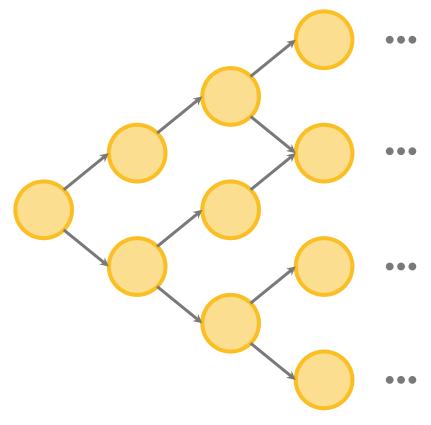

One is aligned with a value if their actions move them towards preferred states.

Value alignment problem: the concept

One is aligned with a value if their actions move them towards preferred states.

Actions get one to preferred states.

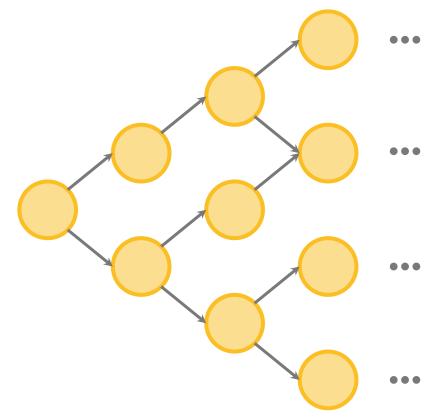

Value alignment problem: the concept

One is aligned with a value if their actions move them towards preferred states.

Actions get one to preferred states.

Norms govern one's behaviour

Value alignment: alignment of norms with values

The transitions between states is governed by norms.

Value alignment: alignment of norms with values

The transitions between states is governed by norms.

Norms change the world: states and transitions.

The degree of alignment of a norm *n* with a value *v* for agent α is the accumulation of preferences along the transitions.

$$\operatorname{Algn}_{n,v}^{\alpha}(\mathcal{S},\mathcal{A},T) = \frac{\sum_{p \in paths} \sum_{d \in [1,length(p)]} \operatorname{Prf}_{v}^{\alpha}(p_{I}[d], p_{F}[d])}{\sum_{p \in paths} length(p)}$$

The degree of alignment of a norm *n* with a value *v* for agent α is the accumulation of preferences along the transitions.

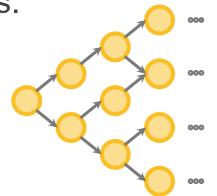

And we consider all possible paths.

$$\mathsf{Algn}_{n,v}^{\alpha}(\mathcal{S}, \mathcal{A}, T) = \frac{\sum_{p \in paths} \sum_{d \in [1, length(p)]} \mathsf{Prf}_{v}^{\alpha}(p_{I}[d], p_{F}[d])}{\sum_{p \in paths} length(p)} \tag{\eqno(b)}$$

The degree of alignment of a norm *n* with a value *v* for agent α is the accumulation of preferences along the transitions.

And we consider all possible paths, giving equal weight to all paths and all transitions.

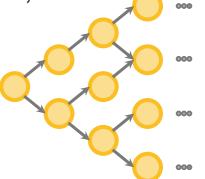

$$\mathsf{Algn}_{n,v}^{\alpha}(\mathcal{S}, \mathcal{A}, T) = \frac{\sum_{p \in paths} \sum_{d \in [1, length(p)]} \mathsf{Prf}_{v}^{\alpha}(p_{I}[d], p_{F}[d])}{\sum_{p \in paths} length(p)}$$

The degree of alignment of a norm *n* with a value *v* for agent α is the accumulation of preferences along the transitions.

For large spaces, we can follow a Monte Carlo sampling approach, where *x* is the number of sampled paths, and *l* the path length:

$$\mathsf{Algn}_{n,v}^{\alpha}(\mathcal{S},\mathcal{A},T) = \frac{\sum_{p \in paths'} \sum_{d \in [1,l]} \mathsf{Prf}_v^{\alpha}(p_I[d], p_F[d])}{x * l}$$

Agents' actions (cooperate (c) & defect (d)) results in certain gains. Let the relevant state parameters describe

accumulated gains: (x,y)

	eta co-operates	eta defects
a co-operates	6,6	0,9
ପ defects	9,0	3,3

Value-based preferences.

States with higher equality in accumulated gain are preferred: |x - y|

$$\mathsf{Prf}(s,s') = \frac{|x-y|}{\max{\{x,y\}}} - \frac{|x'-y'|}{\max{\{x',y'\}}}$$

States with higher equality in accumulated gain are preferred only if my personal gain is not lower:

2
$$\Pr(s, s') = \left(1 - \frac{|y' - x'|}{\max\{x', y'\}}\right) \cdot \frac{x' - x}{\max\{x', x\}}$$

 States with higher personal gain are preferred only if equality is not lower:

3
$$\Pr(s,s') = \frac{x'-x}{2(\max\{x',x\})} - \frac{y'-y}{2(\max\{y',y\})}$$

 States with higher personal gain are preferred, regardless of equality.

4
$$\Pr(s, s') = \frac{x' - x}{\max{\{x', x\}}}$$

Value-based preferences.

FI

States with higher equality in accumulated gain are preferred: |x - y|

$$\mathsf{Prf}(s,s') = rac{|x-y|}{\max{\{x,y\}}} - rac{|x'-y'|}{\max{\{x',y'\}}}$$

States with higher equality in accumulated gain are preferred only if my personal gain is not lower:

2
$$\Pr(s, s') = \left(1 - \frac{|y' - x'|}{\max\{x', y'\}}\right) \cdot \frac{x' - x}{\max\{x', x\}}$$

 States with higher personal gain are preferred only if equality is not lower:

3
$$\Pr(s,s') = \frac{x'-x}{2(\max{x',x})} - \frac{y'-y}{2(\max{y',y})}$$

States with higher personal gain are preferred, regardless of equality.

4
$$\Pr(s, s') = \frac{x' - x}{\max{x', x}}$$

Norms.

• The no taxing - n_0 : No taxes are to be payed.

The incremental taxing - n₁: No taxes to be paid when the gain is 0 or 3, 3 to be paid as taxes when the gain is 6, and 5 to be paid as taxes when the gain is 9.

The fixed taxing - n₂:

1/3 of the gains of each game is to be paid as taxes.

Value-based preferences.

- ♦ States with higher equality in accumulated gain are preferred:

 Prf(s,s') = |x y| / max {x,y} |x' y'| / max {x',y'}

 ♦ States with higher equality in accumulated gain are preferred only if my personal gain is
 - gain are preferred only if my personal gain not lower:

2
$$\mathsf{Prf}(s,s') = \left(1 - \frac{|y' - x'|}{\max\{x', y'\}}\right) \cdot \frac{x' - x}{\max\{x', x\}} (s)^{\frac{|y' - x'|}{|y_1 - y_2|}} (s)^{\frac{|y' - x'|}{|y_$$

 States with higher personal gain are preferred only if equality is not lower:

4	{c,d}	{d}	$n_0 \sim n_1 > n_2$
0084	{c,d}	{c,d}	$\boldsymbol{n}_0 \sim \boldsymbol{n}_1 \sim \boldsymbol{n}_2$

Which norms are better aligned with an agent's interpretation of 'equality'?

All norms (n_0, n_1, n_2) are equally aligned for moderate supporters of equality (\mathbf{Q}, \mathbf{G}).

	α's actions	β's actions	Relative Alignments
0	{C}	{c,d}	$n_1 > n_0 \sim n_2$
0	{c}	{c,d}	$\boldsymbol{n}_0 \sim \boldsymbol{n}_1 \sim \boldsymbol{n}_2$
8	{c}	{c,d}	$\boldsymbol{n}_0 \sim \boldsymbol{n}_1 \sim \boldsymbol{n}_2$
4	{C}	{c,d}	$n_0 > n_2 > n_1$
0	{d}	{c,d}	$\boldsymbol{n}_1 > \boldsymbol{n}_0 \sim \boldsymbol{n}_2$
0	{d}	{c,d}	$\boldsymbol{n}_0 \sim \boldsymbol{n}_1 \sim \boldsymbol{n}_2$
8	{d}	{c,d}	$\boldsymbol{n}_0 \sim \boldsymbol{n}_1 \sim \boldsymbol{n}_2$
4	{d}	{c,d}	$\boldsymbol{n}_0 \sim \boldsymbol{n}_1 > \boldsymbol{n}_2$
0	{c,d}	{C}	$n_1 > n_0 \sim n_2$
0	{c,d}	{C}	$\boldsymbol{n}_0 \sim \boldsymbol{n}_1 \sim \boldsymbol{n}_2$
6	{c,d}	{C}	$\boldsymbol{n}_0 \sim \boldsymbol{n}_1 \sim \boldsymbol{n}_2$
4	{c,d}	{C}	$\boldsymbol{n}_0 \sim \boldsymbol{n}_1 \sim \boldsymbol{n}_2$
0	{c,d}	{d}	$n_1 > n_0 \sim n_2$
0	{c,d}	{d}	$\boldsymbol{n_1} > \boldsymbol{n_0} \sim \boldsymbol{n_2}$
8	{c,d}	{d}	$\boldsymbol{n}_1 > \boldsymbol{n}_0 \sim \boldsymbol{n}_2$
4	{c,d}	{d}	$n_0 \sim n_1 > n_2$
1234	{c,d}	{c,d}	$\boldsymbol{n}_0 \sim \boldsymbol{n}_1 \sim \boldsymbol{n}_2$

Which norms are better aligned with an agent's interpretation of 'equality'?

All norms (n_0, n_1, n_2) are equally aligned for moderate supporters of equality (**2**,**3**).

Except when β 's gains are higher (β always defecting).

	α's actions	β's actions	Relative Alignments
0	{C}	{c,d}	$\boldsymbol{n}_1 > \boldsymbol{n}_0 \sim \boldsymbol{n}_2$
0	{c}	{c,d}	$\boldsymbol{n}_0 \sim \boldsymbol{n}_1 \sim \boldsymbol{n}_2$
8	{c}	{c,d}	$\boldsymbol{n}_0 \sim \boldsymbol{n}_1 \sim \boldsymbol{n}_2$
4	{C}	{c,d}	$n_0 > n_2 > n_1$
0	{d}	{c,d}	$\boldsymbol{n}_1 > \boldsymbol{n}_0 \sim \boldsymbol{n}_2$
0	{d}	{c,d}	$\boldsymbol{n}_0 \sim \boldsymbol{n}_1 \sim \boldsymbol{n}_2$
8	{d}	{c,d}	$\boldsymbol{n}_0 \sim \boldsymbol{n}_1 \sim \boldsymbol{n}_2$
4	{d}	{c,d}	$\boldsymbol{n}_0 \sim \boldsymbol{n}_1 > \boldsymbol{n}_2$
0	{c,d}	{C}	$\boldsymbol{n}_1 > \boldsymbol{n}_0 \sim \boldsymbol{n}_2$
0	{c,d}	{C}	$\boldsymbol{n}_0 \sim \boldsymbol{n}_1 \sim \boldsymbol{n}_2$
8	{c,d}	{C}	$\boldsymbol{n}_0 \sim \boldsymbol{n}_1 \sim \boldsymbol{n}_2$
4	{c,d}	{C}	$\boldsymbol{n}_0 \sim \boldsymbol{n}_1 \sim \boldsymbol{n}_2$
0	{c,d}	{d}	$n_1 > n_0 \sim n_2$
2	{c,d}	{d}	$n_1 > n_0 \sim n_2$
3	{c,d}	{d}	$n_1 > n_0 \sim n_2$
4	{c,d}	{d}	$n_0 \sim n_1 > n_2$
0284	{c,d}	{c,d}	$n_0 \sim n_1 \sim n_2$

In conclusion...

Motivated by some of the ethical concerns, I propose to:

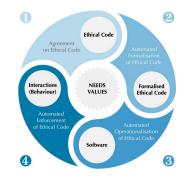

(1) Develop a novel methodology and associated technology for the **design and development** of **responsible autonomy** that are based on people's **needs and values** and that **evolve** with people's evolving needs and values.

(2) **Give people control** over their technologies so they can decide amongst themselves on their needs and values, and how their technology should behave accordingly.

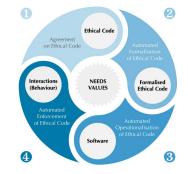

This methodology and technology aim at

- Empowering people to self-regulate their communities, interactions and objectives.
- Helping communities to satisfy Ostrom's principles to guarantee sustainability.
- Supporting **explainability** and **transparency**.
- Providing tools for the analysis, coding and deployment of norms.

And generate plenty of open research questions

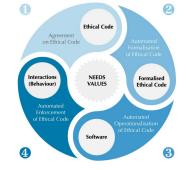

- When are two arguments similar?
- How to extract a normative position from text?
- How to deal with ethical conflict, i.e. conflicting norms?
- How to assess the impact of a normative change?
- How to learn norms from behaviour?
- How to synthesize code that implements norms?
- How to model incentives with norms?
- How to assess the sustainability of a normative system given a set of values shared by the humans?
- Is any set of norms acceptable?
- How to reconcile top-down and bottom-up generated norms?

And generate plenty of open research questions
